◆ What's The Logic Of It All?

Negotiations, Mediation, Arbitration - A Primer

As our readers know, the Coolfont Mountainside Association has filed for arbitration against the Coolfont Development Corporation because the association believes that CDC has not met certain requirements of a 1986 agreement regarding the water and sewer system. Strong views prevail on both sides and different interpretations of the agreement have led to this action

◆◆◆

by CMA. During the week of January 24, 1994, an arbitration panel will review presentations by both parties and deliberations will begin. By the end of the hearing (s), the arbitrators will make an award and, once and for all, the parties will know who's right and who's wrong in the dispute. Running parallel to the arbitration activity is a mediation effort. Like the arbitration, the process is being conducted under the auspices of the American Arbitration Association. The objective is for both parties to reach a compromise on positions they've "put on the table", this with assistance from a third party. If mediation fails, then impasse will be declared and arbitration will be the final recourse for CMA and CDC. The parties are not precluded from negotiating with each other as all the formality continues. It is CMA's hope that a settlement can be reached by crafting an agreement

COOLFONT HOME WINTERIZING . . . -SOME HINTS

Because nearly 50% of all Coolfont homeowners are involved in the Coolfont rental program, they won't have to read this article. For the rest, we suggest you press on. Frozen water breaks pipes and plumbing fixtures. Properly draining all water from pipes before a hard freeze is priority one. Before draining, the main home water system shut off valve should be closed and water drained by opening every water outlet. When the job is complete and with the main valve shut, slightly open each outlet for the winter assuring draining is complete. In the old days, people actually let a (Continued, back)

Maintaining Your Home ... Mr. or Ms. Fix It Arrive

Your favorite program is Home Improvement (Wed. 9:00 P.M. ABC) and you love to shop at Home Depot, Hechingers and Sears. You're handy (or cheap) and you believe you can save a few bucks and earn the pride of a craftsman while reflecting on your accomplishments each evening.

◆◆◆

O.K., we'll buy your premise. In case you haven't taken any industrial arts courses lately, here are a few hints: Tools: While you can buy a hacksaw for $ 2.99, a hammer for a dollar, and a twelve piece screwdriver set for $4.99, you really get what you pay for. Cheap tools lead to trouble. Screwdrivers don't keep their edges, hammer heads get loose and inferior saw blades break when any pressure is applied. Bad tools are a leading cause of most accidents. Power tools with cuts or tears in electric cords and beat-up plugs are a big headache. When a plug is old, it may not ground correctly or keep falling out of the electrical receptacle, causing lots of inconvenience. Extension cords should also be in good shape with grounding capability at both ends. That old extension lamp cord should not be used for a variety of reasons. Dull blades are very dangerous, especially on power saws, and doing any sawing without decent safety glasses is asking for trouble. Sawing without devices to hold (con't back)

The Coolfont Mountainside Association is made up entirely of volunteers. Only two of our members who serve in a speciality capacity are remunerated for part time work. Ms.Minnamon, and Mr. Place help us by checking water reservoirs, ordering repairs, installing signs, measuring water quality, filling potholes and keeping watch. One of our past Board members, Mr. Gale Conner has been extremely helpful in bridging communications and helping us during emergencies. Our thanks is extended.

Winter

Water, Oil, Heat, Common Sense con't

stream of water flow from the lowest faucet all winter! Water costs too much for that practice today. Oiling hinges with WD 40 and lubricating other metal parts is another good idea. Winter has a drying effect and is tough on metal parts. Dry lube for locks is recommended and spraying silicone on door and window jambs is a good idea for most standard installations. Gutters: Clean them! Make sure water flows freely through down spouts. Cleaning glass before winter arrives makes it a lot easier to clean in the Spring. Leave the thermostat at about 45 degrees. When wood and other materials in homes gets too cold, damage can occur. Leave drapes open for airing purposes. Remove all materials that are stacked against the sides

NEWS AND NOTES

Sam Hospitalized: Sam Ashelman was hospitalized during the week of Nov. 12th. Sam is feeling better and will probably be back by newsletter delivery time. Your president sent best wishes on behalf of the entire association.

Water Bill Time: The May 15th to Nov 15th water bills are being sent to homeowners. The bills reflect increases for the larger users of water as voted by the membership in September. Paying on time avoids a late charge. Your past cooperation has been greatly appreciated. Thanks to Jim Bradfield for reading meters and preparing bills.

Reservoir Cleaning: Scheduled between November 29th and December 22nd. We're trying for no service disruptions, but there are no guarantees. If water is discolored, let it run for awhile.

White Trail: A CDC-CMA tentative pact has resulted in a trail with new temporary markings which run east from Bobcat Rd. and Wintergreen Way. If no objections are raised to the new proposed routing by the end of December, CMA and CDC will finalize their agreement on the route.

MAINTAIN YOUR HOME Some Hints - con't

materials in place is another practice of do it yourselfers and one that usually produces inferior work. Stanley makes a nice work table with clamping devices for under $70.00. Materials: Do not use materials that have been sitting around too long. Rusty nails, damp wood, etc., usually lead to grief. Priorities: Work on roof leaks first, electrical second, plumbing third,(unless its the head!) cosmetics last. Work electrical when there is plenty of light because you'll have to turn off your electricity on most jobs. Any electrical work requires dry shoes. Use a tool box. Most people end up tired because of the number of trips to find tools, chase materials and find equipment. Clothing: It may not be an issue to you, but incorrect clothing can cause plenty of trouble. Sleeves can get caught on things and in power tools. The wrong shoes can be dangerous on ladders. Moving back and forth between a warm house and a cold exterior isn't too brilliant and wearing the correct glasses can be very important. For the bifocal set, we suggest those ties used by boaters and sunbathers so glasses won't get lost. Correct tape: Use electrical tape for electrical work, masking tape is used for painting and duct tape is used on heating/cooling ducts. That's all for now, hope this helps.
